                                                              Kossai S., van der Sluis W.G., Boelens R., T'Hart L.A., Labadie R.P., "Labaditin, a novel cyclic decapeptide from the latex of Jatropha multifida L. (Euphorbiaceae). Isolation and sequence determination by means of two-dimensional NMR.";
FEBS Lett. 256:91-96(1989).
-!- FUNCTION: Labaditin is an active peptide which inhibits the classical pathway of complement activation in vitro. Activity seems to be based on an interaction with Cl.
-!- FTM: This is a cyclic peptide.
-!- MISCELLANEOUS: Latex of this plant is used in folkloric medicine for treatment of infected wounds, skins infections and scabies.

Midferences in the skin peptides of the male and female Australian tree frog Litoria splendida. The discovery of the aquatic male sex pheromone splendipherin, together with Phe8 caerulein and the antibiotic peptide caerin 1.10.";
Biochem. 267:269-275(2000).
--- FUNCTION: Hypotensive neuropeptide (Probable).
--- SUBCELLULAR LOCATION: Secreted.
--- TISSUE SPECIFICITY: Skin dorsal glands.
--- PTM: Isoform 1.274 differs from isoform 1.2 in not being sulfated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

bind to the nicotinic acetylcholine receptors (nAChR) and thus inhibit them. It is highly active against the neuromuscular receptor in frog but not in mice and rats, it induces seizures when injected centrally in mice and rats. It targets neuronal naChRs in mammals. It blocks homomeric alpha-7 nicotinic receptors with the highest apparent affinity and homomeric alpha-9 receptors with 8-fold lower affinity. It has no effect on receptors composed of alpha-2/beta-2, alpha-4/beta-2, alpha-4/beta-2, alpha-4/beta-4, subunit combinations.

SUBCELDULAR LOCATION: Secreted.

"The small subunit of the mammalian mitochondrial ribosome:
identification of the full complement of ribosomal proteins present.";
J. Biol. Chem. 276:19363-19374(2001).
-: SUBUNIT: Component of the mitochondrial ribosome small subunit
(28S) which comprises a 12S rRNA and about 30 distinct proteins.
-: SUBCELBULAR LOCATION: Mitochondrial.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          "Isolation, primary structure and synthesis of leucokinins VII and VII: the final members of this new family of cephalomyotropic peptides isolated from head extracts of Leucophaea maderae."; Comp. Biochem. Physiol. 88C:31-34(1987).
-!- FUNCTION: This cephalomyotropic peptide stimulates contractile activity of cockroach protocdeum (hindgut).
-!- SUBCELLULAR LOCATION: Secreted.

"Primary structure of two neuropeptide hormones with adipokinetic and represent activity isolated from the corpora cardiaca of horse of hypotrehalosemic activity isolated from the corpora cardiaca of horse of lies (Diptera).",

Proc. Natl. Acad. Sci. U.S.A. 86:8161-8164(1989).

- I- FUNCTION: Hypertrehalosemic factors are neuropeptides that elevate the level of trehalose in the hemolymph (trehalose is the major carbohydrate in the hemolymph of insects).

- SUBCELLULAR LOCATION: Secreted.
- SIMILARITY: Belongs to the AKH / HRTH / RPCH family.

PIN: B33955, B33955.
